### Description

General information The main cause of the problem with excessive facial hair is genetics, occasionally the development of cysts and a large number of male hormones become a factor of an unpleasant aesthetic defect. Excessive amounts of facial hair can be caused by hormonal disruption due to various diseases. The first results are already visible after 8 weeks of therapy. More than 60% of women completely got rid of facial hair after six months, which no other cream can boast. Similar results were also shown in laboratory conditions. Women can also use this medicine in a combination therapy, combining it with other methods to remove unwanted hair. Its effectiveness of the drug is obliged to the active substance called Eflornithine, which is fully approved by the American Association for the Food and Drugs Control. This organization is very strict about the certification of products and requires a full range of inspections, which guarantees safety for patients. The cream should be used regularly, as in case of therapy interruption, the enhanced hair growth will return again. You don't need to sacrifice your beauty, you can continue to apply your usual care cosmetics, just don't forget to use the medicine twice a day. It's manufactured by renowned pharmaceutical company Ranbaxy Laboratories Limited (India). This is a complete analogue (generic) of the world's most popular means for combating excessive hair on the body. The remedy produced in India has a more affordable cost, since the buyer doesn't have to overpay for patent rights that are included in the price. It was created specifically for women suffering from excessive facial hair. At the same time its effect is very gentle and it doesn't irritate the skin. Only less than 1% of all patients showed a slight reddening of the skin area due to individual intolerance. This remedy inhibits the enzyme that is necessary for facial hair growth. Clinical studies demonstrated a significant efficacy of this drug in reducing facial hair growth. Positive results were obtained in 60% of women who used the cream for 24 weeks. The visible effect occurs after 2 months from the beginning of the application, so women can continue to use their usual methods of hair removal during the first time. This product has a lot of advantages: actually visible result of reducing the amount of hair; no ban on the use in intimate areas; complete safety of use; there are no manifestations of side effects; affordable cost of therapy; the product can be used with any type of skin; full approval of cosmetologists and dermatologists; no ban on the use in combination therapy with other procedures to remove excess hair growth on the face and body. An additional advantage is the availability of quality certificates. The remedy is available in the form of a low-fat cream in a small tube of 15 g. Experts emphasize that, strictly speaking, it's best used in combination with other methods, especially with laser hair removal. If you use Vaniqa – Eflornithine, it will increase the effectiveness of the procedure, and possibly

completely stop hair growth. However, other experts say that the cream itself can remove hair, but this will require patience and time — it can take from eight weeks to six months before the result becomes noticeable. It should be applied twice a day. Vaniqa is best for removing facial hair. Because it's quite expensive and difficult to apply, it's not recommended to be used for removing hair on large areas, for example, on the legs or hands. With the help of this product you can remove light and gray hair without laser. Studies show that this product is safe for the ladies who take combined contraceptives and other hormonal drugs. In addition, it can be applied by representatives of all ethnic groups and people with all skin types. What is Vaniqa? Vaniqa is a prescription cream used to reduce unwanted facial hair in women. Its active ingredient is eflornithine, which interferes with a chemical in hair follicles under the skin, slowing hair growth where the cream is applied. How is Vaniqa used? Vaniqa is applied to the skin twice a day, at least eight hours apart. It should be applied to clean, dry areas of the face and adjacent affected areas under the chin, rubbing in thoroughly. What are the side effects of Vaniqa? Common side effects of Vaniqa include skin irritation, such as redness, burning, stinging, tingling, itching, or rash. Acne, ingrown hairs, dry skin, and headaches have also been reported. How long does it take for Vaniqa to work? Improvements with Vaniqa can be seen as early as 4 to 8 weeks of treatment. However, results vary for each individual, and it may take longer in some cases.

Continuous use is recommended to maintain results. Can Vaniqa cure facial hair growth? Vaniqa does not cure facial hair growth. It helps manage the condition by slowing hair growth but does not eliminate hair. Hair growth may return to its pre-treatment level if you stop using Vaniqa. Is Vaniqa suitable for everyone? Vaniqa is specifically designed for women and should not be used by men. It is not suitable for children under 12 and should be used with caution in patients with certain skin conditions or sensitivities. Can Vaniqa be used with other hair removal methods? Yes, Vaniqa can be used in conjunction with other hair removal methods, such as shaving or plucking. It's advisable to wait at least 5 minutes after hair removal before applying Vaniqa. How should Vaniqa be stored? Vaniqa cream should be stored at room temperature, away from heat and direct light. Keep it out of reach of children and pets, and do not freeze the cream. Does Vaniqa have any hormonal effects? Vaniqa works locally at the site of application and does not have hormonal effects. It does not affect hormones or the endocrine system. Can Vaniqa be used during pregnancy or while breastfeeding? The safety of Vaniqa during pregnancy or breastfeeding is not well-established. Consult with a healthcare provider to weigh the potential risks and benefits before using Vaniqa in these situations. Precautions Vaniqa (Eflornithine) is used exclusively externally. It's forbidden to apply it at damaged skin areas (on scratches, cuts, burns etc.). No contact with sense organs is allowed. At pregnancy and breastfeeding, consult with your doctor before using the drug. In the first line the patient must inform the physician about the presence of allergies, disorders and diseases, essential information about the patient's history and his relatives, as well as taking other medicines, including dietary supplements and herbal preparations. Vaniqa Dosage To prevent the spread of unwanted facial hair on the face, the substance has to be gently rubbed onto the affected areas, as well as on the places adjacent to them, with soft massage movements. For better effect, the skin can be pre-cleaned so that the active substances can penetrate as far as possible into the hair follicle. After using you shouldn't wash and put makeup on your face for the first four hours. Generic Vaniqa is used twice a day with a time interval of eight hours. Sometimes a specialist can prescribe an individual therapy that has adjusted dosages, taking into account the abundance of facial hair. As a rule, this happens only in cases where the amount of unwanted hair on a woman's face is close to the male type. Women who use this remedy in complex treatment with salon or home treatments for removing unwanted hairs should apply it within five minutes after the session. If there is no time to wait four hours, cosmetics and other creams can be used after complete absorption of the remedy. It should be understood that the drug doesn't remove unwanted hair from the face. It affects the hair follicle, slowing its development and producing new hairs. Since this takes some time, the real result will be noticeable after several weeks of treatment. As soon as the patient stops using the drug, the excess hair will return again. Due to the fact that the cream has no side effects, it can be used without prior consultation with the doctor. How to take Vaniqa? Several thousand women suffering from excessive hair covering have been able to regain their beauty without sacrifice and unnecessary costs. To do this, they used the drug twice a day, dividing the application in the eight-hour periods. After using you shouldn't wash during the next four hours as not to prevent the deep penetrating into the hair follicle. If the product is ordered to restrain hair growth after they are removed with the help of depilation, apply it in 5-7 minutes after the procedure. Using this medicine doesn't prohibit the use of other creams and cosmetics. Vaniqa Side-effects When using the cream, minor side effects may

occur, such as temporary redness, burning sensation, tingling, rashes, etc. Read the instructions carefully before using the drug. In the event of side effects immediately stop using the product. It's recommended to apply first a small amount of the remedy penetrating on a limited area of the skin to make sure there are no irritation and other negative reactions. Vaniqa Overdose Scientific data on overdose are not available. In the case of excessive use the manifestation of side effects may increase. Observe the dose and proper intervals given in the instructions. In the event of side effects due to overdose, remove the product from the skin with a damp cloth or paper towel and rinse the treated areas with water. Don't reapply it before consulting with your doctor or dermatologist. For more information, contact the manufacturer's custom service department. You can also ask questions to the distributor of this drug, or contact representatives of the manufacturer.

Interactions Scientific data on the interaction with other drugs are missing. A simultaneous application of this substance with other active preparations for external use should be avoided. Simultaneous use of other drugs orally or intravenously does not affect the effect of the cream. In case of adverse reactions, it's recommended to immediately seek medical attention. To obtain the most qualified advice, you must show the doctor the packaging of both drugs. Alcohol interaction A simultaneous use of the drug with alcohol in large quantities is contraindicated. To avoid the occurrence of side effects and unexpected reactions, observe a considerable time interval between the application of the product and alcohol intake. Since alcohol increases blood circulation in the vessels, the skin's sensitivity to the effects of the medicine increases, which in turn can cause undesirable reactions and reduce the effectiveness of its action. Vaniqa Reviews Lina, 28: I buy it constantly. It's most pleasant product for removing excessive hair. It doesn't stink, it's not sticky, it's easily washed off. I like it. Sarah, 37: Many people advise to try this, but after the first time I had a terrible itching at the area of application. I can't recommend this to anyone. Mary, 54: There were many difficulties with the removal of excessive hair from the face. On the recommendation of using this cream, the result exceeded my expectations. Now I use it regularly, the price and quality are completely satisfying, there are no side effects. Jane, 34: Me and my friend have used it many times, the effect is more or less satisfied, there are more effective drugs, but the price is much higher. A friend of mine began to feel side reactions due to too frequent use. I try to avoid overdosing in order to protect the skin. Tracey, 27: It helps always! An indispensable mean in the fight against excess hair on the face. At first I thought that it would hardly help, I decided to try. I was convinced that it works effectively, reapplication is required after about four months! I recommend it to everyone. I have been using it for two years now, there were no problems and side effects. I like the light texture and convenient packaging. Gala, 40: This is probably the most effective way to remove excess facial hair. I used it many times, and it never failed. Sometimes there is a burning sensation on the skin after the application, but it passes quickly. The main thing is not to smear in places of scratches or other wounds. It's very irritating; wounds heal more slowly than usual after this.
